

SUPPLY CHAIN MAPPING END-TO-END

Supply Chains as ecosystems of suppliers, partners and customers move at an unprecedented speed when we consider the complexity that is built into each of the networks that feed our supply chains. Because of this very complexity, we need **clarity**.

STEP 2: STUDY NETWORK

With the data gathered in step 1, we then look for patterns, schedules, cost saving opportunities, performance issues and operational challenges your business might be facing now with a projection of what might be in the future. Here we start building scenarios.

STEP 1: PERFORM ASSESSMENT

We gather a list of suppliers, customers, product lines, transshipment points, logistics service providers, regularity of shipments and volumes to create a first snapshot of your Operations.

STEP 3: CREATE A VISUAL MAP

We draw the network end to end with an emphasis of critical points we have found during our study - from delays to costs and operational decisions that were taken during live operations - and present the overall structure with suggestions for improvement to your management team.
